Several of your Microsoft Office InfoPath forms gather data from Web services by using data connections. You discover that Web-enabled forms that are created by users cannot gather data from these Web services. You need to ensure the data from these Web services is accessible to the user-created forms. What should you do?

- A. Enable the Web service proxy for user forms.
- B. Enable cross-domain access for user form templates.
- C. Embed authentication in the connection string.
- D. Configure SSL for HTTP authentication to data sources.

Your company has a Web-enabled forms library, which is accessed daily by approximately 10,000 users.   While monitoring your network bandwidth, you discover that the session data for your InfoPath forms is always lower than 40 KB.   You need to decrease the work load on your Microsoft SQL Server computer.   What should you do?

- A. Configure InfoPath Forms Services for cross-domain data access.
- B. Implement a data connection file for InfoPath Forms Services.
- C. Set Form Session State to Form view.
- D. Configure InfoPath Forms Services to allow SQL Server authentication.

Your company uses an application that creates documents that have a .xyz extension.   Users report that when they perform searches from the root SharePoint site, documents that have the .xyz extension appear in the search results only if the search query includes the file name.   You need to ensure that the content from documents that have the .xyz extension is included in the search results.   What should you do?

- ○ A . Create a new content type for documents that have the .xyz extension.
- ○ B . Create a new search scope named xyz.
- ○ C . Implement a new keyword best bet for xyz.
- ○ D . Implement a custom IFilter that handles .xyz files.
